

Lab 10 work to Git, using the exact workflow your NTU GitLab server expects.

I will give you *two versions*:

1. **If you cloned the repo correctly at the start** (most likely — you used the Jupyter terminal earlier).
2. **If you didn't clone correctly** or you're unsure — I'll show how to confirm.

You only need **one**, but I'll guide you exactly.

Before we start — the 3 things Git needs from you

To successfully push:

1. You must be **inside the cloned repo folder**
2. Git must know your **remote URL** (GitLab)
3. You must run the correct **add** → **commit** → **push** sequence

If any of these three is missing, Git won't push.

You already appear to be inside:

C:\Users\somto\Documents\Graduate Degree Applications\Nottingham Trent University\2. Second Term 2026\Computational Intelligence\Section 10\comp40771_lab10

But let's confirm.

STEP 1 — Confirm this folder really is a Git repo

Run this in PowerShell:

Shell
git status
Show more lines

Expected (good):

On branch main
Changes not staged for commit:
...

If you see:

fatal: not a git repository (or any of the parent directories): .git

then you cloned into the wrong folder or copied files manually.

If that happens, tell me — I'll fix it.

STEP 2 — Confirm the remote URL

Run:

Shell
git remote -v
Show more lines

Expected output (example):

```
origin https://olympus.ntu.ac.uk/N1419979/comp40771_lab10.git (fetch)
origin https://olympus.ntu.ac.uk/N1419979/comp40771_lab10.git (push)
```

If it's missing or wrong, I'll repair it for you.

STEP 3 — Stage all your updated files

From your lab root folder:

Shell

```
git add .
```

Show more lines

This stages:

- monitor/
 - configs/
 - reports/
 - docker-compose.yml
 - README.md
 - everything else
-

STEP 4 — Commit with a clear coursework message

Shell

```
git commit -m "Completed Lab 10 monitoring system + documentation"
```

Show more lines

If Git says:

Nothing to commit

then you didn't change anything since last commit.

If Git says:

Please tell me who you are

run:

Shell

```
git config --global user.email "YOUR_NTU_EMAIL"
```

```
git config --global user.name "YOUR NAME"
```

Show more lines

Then repeat the commit.

STEP 5 — Push to GitLab

Shell

```
git push origin main
```

Show more lines

If your branch is called **master**, then:

Shell

```
git push origin master
```

Show more lines

Typical prompt:

Username: N1419979

Password: <your NTU password>

Or if NTU uses PAT tokens, GitLab will guide you.

STEP 6 — Verify push on the GitLab website

Open:

https://olympus.ntu.ac.uk/<your_student_number>/comp40771_lab10

Check that:

- monitor/ directory is present

- docker-compose.yml is updated
- README.md is included
- your updated utils/ and agents/ files appear

This is your submission area.

★ **If any push error appears — tell me EXACTLY what Git prints.**

I will immediately fix it.

★ **Optional: Create a tag for submission (recommended by NTU)**

Shell

```
git tag lab10-final
```

```
git push origin lab10-final
```

Show more lines

This freezes the submission snapshot.
